Write a Python program for binary search.

For example:

| Input             | Result |
|-------------------|--------|
| 1,2,3,5,8<br>6    | False  |
| 3,5,9,45,42<br>42 | True   |

Answer: (penalty regime: 0 %)

```

1 A=sorted(list(map(int,input().split(','))))
2 B=int(input())
3 left,right=0 , len(A)-1
4 C= False
5 while left<=right:
6     mid=(left+right)//2
7     if A[mid]==B:
8         C=True
9         break
10    elif A[mid]<B:
11        left=mid+1
12    else:
13        right=mid-1
14 print(C)

```

Given an [list](#), find peak element in it. A peak element is an element that is greater than its neighbors.

An element  $a[i]$  is a peak element if

$A[i-1] \leq A[i] \geq a[i+1]$  for middle elements.  $[0 < i < n-1]$

$A[i-1] \leq A[i]$  for last element  $[i=n-1]$

$A[i] \geq A[i+1]$  for first element  $[i=0]$

**Input Format**

The first line contains a single integer  $n$ , the length of  $A$ .

The second line contains  $n$  space-separated integers,  $A[i]$ .

**Output Format**

**Print** peak numbers separated by space.

**Sample Input**

5

8 9 10 2 6

**Sample Output**

10 6

**For example:**

| Input         | Result |
|---------------|--------|
| 4<br>12 3 6 8 | 12 8   |

**Answer:** (penalty regime: 0 %)

```

1 def findPeak(a):

Bubble Sort is the simplest [sorting](#) algorithm that works by repeatedly swapping the adjacent elements if they are in wrong order. You read an [list](#) of numbers. You need to arrange the elements in ascending order and print the result. The [sorting](#) should be done using bubble sort.

**Input Format:** The first line reads the number of elements in the array. The second line reads the array elements one by one.

**Output Format:** The output should be a sorted [list](#).

For example:

| Input            | Result      |
|------------------|-------------|
| 6<br>3 4 8 7 1 2 | 1 2 3 4 7 8 |
| 5<br>4 5 2 3 1   | 1 2 3 4 5   |

**Answer:** (penalty regime: 0 %)

```

1 n=int(input())
2 arr=list(map(int,input().split()))
3 for h in range(n):
4     for e in range(0,n-h-1):
5         if arr[e]>arr[e+1]:
6             arr[e],arr[e+1]=arr[e+1],arr[e]
7 print(' '.join(map(str,arr)))

```

|   | Input             | Expected     | Got          |   |

| ✓ | 6<br>3 4 8 7 1 2  | 1 2 3 4 7 8  | 1 2 3 4 7 8  | ✓ |
